## EXPERIMENT

Title

### DIWALI CONTEST

Description

Max is planning to take part in a Diwali contest at a Diwali Party that will begin at 8 PM and will run until midnight (12 AM) i.e., for 4 hours. He also needs to travel to the party venue within this time which takes him P minutes. The contest comprises of N problems that are arranged in order of difficulty, with problem 1 being the simplest and problem N being the most difficult. Max is aware that he will require  $5^i$  minutes to solve the  $i^{\text{th}}$  problem.

Your task is help Max find and return an integer value, representing the number of problems Max can solve and reach the party venue within the given time frame of 4 hours.

Note: Max will leave his home at exactly 8 PM to reach the party venue.

Input Format:

input1: An integer value N, representing the total number of problems.

input2: An integer value P, Representing the time to travel in minutes from his home to the party venue.

Example:

Input:

6

180

Output:

4

Explanation:

The amount of time left to solve the problems is  $4 \times 60 - 180 = 60$  mins.

1st Problem - 5 mins, Time left =  $60 - 5 = 55$  mins

2nd Problem - 10 mins, Time left =  $55 - 10 = 45$  mins

3rd Problem - 15 mins, Time left =  $45 - 15 = 30$  mins

4th Problem - 20 mins, Time left =  $30 - 20 = 10$  mins

5th Problem - 25 mins

So he can solve only 4 problems as he is not left with 25 mins to complete 5th problem.

Source Code:

```
def max_problems_solved(N,P):
    remaining_time=240-P

    time_spent=0
    count=0

    for i in range(1,N+1):
        time_to_solve=5*i

        if time_spent+time_to_solve>remaining_time:
            break

        time_spent+=time_to_solve
        count+=1

    return count
N=int(input())
P=int(input())
result=max_problems_solved(N,P)
print(result)
```
